If you want to get the most out of working with an image file, you should understand what it contains. Your image files are folders of information. Everything you see in your image window on the screen is an element of that file. You can edit a file — add, subtract, hide, and adjust the appearance of a specific part of the image — and then save it to disc, print it, or copy it to a website for online sharing. Each time you edit the file, you add or remove information from the file. As you create and delete layers, you add or delete that information. So the bigger and more complex the file, the more complicated it can be to work with. If you want to get the most out of your images, you should know what information is in that file, where it's located, and how it's organized.

The Content-Aware Resampling tool allows you to either reduce or increase the resolution of an image. It is also referred to as image scaling. The Burn tool allows you to make an area transparent by increasing the alpha channel of a pixel, and can be used to erase small objects from an image. The Content-Aware Fill tool is a feature that allows you to replace content from one area of an image with content from another. For example, if you had a shoe outline on an image, and filled in

the rest with unknown content, this tool can be used to "learn" that unknown content and replace it with the definition of the shoe outline. The Healing tool replaces pixels that are out of place on an image. This can be used to remove small blemishes or spots of dust or dirt. The Mask tool allows you to protect or reveal parts of an image by completely or partially hiding them. This can be useful for cutting objects out from an image, or for adding and removing elements such as fireflies or a close up of a face. The Pen tool allows you to draw objects, lines, and paths on images, and can be used to create basic designs such as a star, a sun, or a logo. The Crop tool allows you to crop or trim an image. It also allows you to crop an image in portions. This can be used to trim your images to a specific resolution, crop out

unwanted areas, or remove a person from a picture without having them appear digitally removed or vanish from the photograph entirely. The Posterize effect applies a "graduated" filter to an image that gradually reduces and then removes the brightness or contrast of an image. This can be used to reduce the amount of light in an image, or to apply a soft filter to make an image look old and faded. The Saturate effect allows you to preserve the average brightness of an image, while increasing or decreasing the brightness of its most intense colors.
